

MergeCallibr-Jev

Probabilistic pull request triage that reduces unnecessary human review.

THE BOTTLENECK

AI increases the speed and volume of code changes, but developers still spend significant time understanding and validating pull requests. Review effort becomes the bottleneck.

HOW THE APP WORKS

CORE IDEA

DeepSeek provides semantic understanding. Jev turns that understanding into typed decisions with probabilities. Application logic then determines whether the PR can stay in the normal workflow or needs human attention.

From model output to developer action

The interface should make the value of automated triage visible in seconds.

PULL REQUEST QUEUE

#1482	Migrate session validation to edge KV store	Escalated	risk 0.88
#1398	Fix database connection pool timeout	Needs review	risk 0.42
#1356	Update dependency version	Approved	risk 0.05
#1347	Refresh worker cluster docs	Approved	risk 0.02

SELECTED PR #1482

JEV VERDICT

RISK SCORE

0.88

CONFIDENCE

94%

SUBSYSTEM

AUTH / SESSION

HUMAN REVIEW REQUIRED

Reason: session token handling changed and the decision layer detects a high probability of security risk.

DECISION FACTORS

Session token handling		0.86
Access control		0.64
Error handling		0.31
